

# Gas Pressure Regulator HON 370

PRODUCT INFORMATION

**Serving the Gas Industry  
Worldwide**

**Honeywell**

## Gas Pressure Regulator HON 370

Applications, characteristics, technical data

### Applications

- Direct-acting gas pressure regulator for commercial and industrial applications and local supply stations.
- Especially suitable for dynamic regulating lines (e.g. gas furnaces, burner switching, gas engine operation)
- Can also be used as a component for gas consumption devices according to EC Directive (90/396/EEC)
- As a gas pressure regulating device with electrical consequential value (motorised actuator) and pneumatic consequential setpoint
- Suitable for gases in accordance with DVGW Worksheet G 260 and neutral, non-aggressive gases; other gases on request

2

### Characteristics

- Version with integral overpressure protection (IS)
- Fail open (FO) error type
- Gas pressure regulator with incorporated axial safety shut-off valve (SSV) – optional designs with safety relief valve (SRV) for the relief of leakage gases or with safety diaphragm
- Large inlet pressure range
- Optional installation of different valve seat diameters is possible
- Easy to maintain, thanks to interchangeable functional units (plug-in modules)
- SSV optionally available in function class A or B
- Pressure equalisation valve (internal bypass) integrated in the SSV actuator

### Versions (options)

- Without SSV
- SSV with manual release
- Electromagnetic remote release with SSV
- With electric SSV 'CLOSED' position indicator by means of inductive proximity initiator or reed sensors and intrinsically safe current circuit
- Regulating device with leak gas SRV ( $p_d$  up to 0.8 bar) or safety diaphragm ( $p_d$  up to 1.0 bar)
- With vent valve HON 915 (SSV/RA) or tripping valve HON 919 (SSV)
- With noise reduction

\*) Valve flow rate coefficient for natural gas:  $d = 0.64$  ( $\rho_n = 0.83$  kg/m<sup>3</sup>),  $t_U = 15^\circ$  C

\*\*) The limitation of the maximum inlet pressure range  $\Delta p_{U\ max}$  does not occur due to strength reasons; it is intended to maintain the accuracy class AC.

\*\*\*) For outlet pressures  $p_d > 200$  mbar, otherwise  $p_{U\ max} = 10$  bar  
Other pressures on enquiry.

SSV-E setting ranges for Control devices of the TYPE HON 673, K1a and K2a								
Control unit	Setpoint spring			Upper response pressure*		Lower response pressure*		Accuracy group
	No.	Wire $\varnothing$ (mm)	Colour coding	Upper setting range $W_{dso}$ (mbar)	Min. re-engage differential* between response pressure and normal operating pressure* $\Delta p_{wo}$ (mbar)	Lower setting range $W_{dsu}$ (mbar)	Min. re-engage differential* between normal operating pressure* and response pressure $\Delta p_{wu}$ (mbar)	
K1a	01	2.25	green	25 to 50	20			10/5
	1	2.60	yellow	50 to 100	20			10/5
	2	3.20	light red	80 to 250	50			5
	3	3.60	dark red	200 to 500	80			2.5
	4	4.75	white	500 to 1,500	100			2.5
	5	1.00	yellow			10 to 15	12	10
	6	1.20	white			14 to 40	30	10/5
	7	1.40	black			35 to 120	60	5
K2a	8	2.25	bright red			100 to 300	100	5
	4	4.75	white	1,500 to 4,500	250			5/2.5
	9	5.30	ivory	4,000 to 7,000	300**			1
	5	1.10	light blue			60 to 150	50	10/5
	6	1.40	black			120 to 400	100	5
	8	2.25	bright red			350 to 1,000	150	5

\*) PLEASE NOTE: If the control device is configured to handle both overpressure and underpressure release, the difference between the setpoints of ( $p_{dso}$  and  $p_{dsu}$ ) must exceed the sum of the values set for  $\Delta p_{wo}$  and  $\Delta p_{wu}$  by at least 10%.  
 $(p_{dso} - p_{dsu})_{min} = 1.1 \cdot (\Delta p_{wo} + \Delta p_{wu})$

\*\*) We recommend a maximum re-engage differential of  $< 4.5$  bar to facilitate engaging the control device.

\*\*\*) The higher AG group applies to the first half, the lower AG group to the second half of the setting range.

Integrated safety relief valve (leakage gas SRV) can only be used up to $p_{ds\ max} = 0.8$ bar			
No.	Setpoint spring		Regulating assembly

#### Construction and mode of operation

The purpose of the direct-acting gas pressure regulator HON 370 is to substantially stabilise the outlet pressure independently of any inlet and outlet pressure changes in the regulating line. The device consists of a regulating assembly (1), final control element (2), SSV final control element (3) with tripping device (4) and control device (5) and the main valve body (6). The required setpoint is adjusted via the setpoint adjuster (14).

The control element of the regulating assembly is equipped with a pressure-compensating diaphragm (7). The regulating assemblies RA 1, RA 2 and RA 3 may be optionally equipped with a safety relief valve (9). The outlet pressure you want to control is fed to the measuring diaphragm unit via the measuring line connection. The measuring unit compares the actual value to the setpoint defined by the force of the setpoint spring (10). If a deviation is detected, the valve stem (11) will adjust the control element (2) in order to match the actual value to the setpoint again. At zero drop, the device will seal bubble-tight.

The version with a safety diaphragm RE 1, RE 2 and RE 3) has an extra diaphragm (52) across the measuring diaphragm (8) which will seal the upper part of the diaphragm body in case the diaphragm (8) breaks so that the gas cannot escape into the atmosphere.

A metal foam cylinder (12) may be inserted into the control element to reduce noise.

If the outlet pressure exceeds or falls below the predefined limit values, the upstream safety shut-off valve will stop the gas flow. To accomplish that, the measuring diaphragm (20) of the control device (5) is shifted according to the comparison of set and actual values in such a way that the balls (21) of the release mechanism release the switch stem (22). Through the spring force of the spring (24), the switch stem will flip against the bush of the tripping device (4), thus unblocking the axle (23) of the SSV control element (3) so that the SSV closes. Now the SSV may be opened only by hand. For this, the outlet pressure at the measuring point must be reduced below the overpressure release / increased above the underpressure release by a value that must correspond at least to the re-engage differential ( $\Delta p$ ).

#### Assembly, commissioning and maintenance

For assembly and maintenance, please refer to DVGW Worksheets G 491, G 495 and G 600, and the manual.

The "Operating and maintenance instructions ; spare parts" contain detailed information on installation, start-up, maintenance and the most important spare and replacement parts.

The gas pressure regulator should preferably be installed in the pipework in a horizontal position.
